Abstract

Software projects often contain numerous requirements that compete for limited development time and resources, making effective prioritization challenging. This project proposes an AI-driven requirement prioritization system that analyzes software requirements based on stakeholder value, development risk, urgency, complexity, and dependencies. Using Natural Language Processing and Machine Learning, the system assigns priority scores and recommends an optimal implementation order. The system can dynamically update priorities when project conditions or requirements change, supporting adaptive decision-making. The proposed solution aims to improve development planning, reduce project risks, and help Agile teams make data-driven requirement prioritization decisions.
